Utopian Tree

The Utopian Tree goes through 2 cycles of growth every year. Each spring, it *doubles* in height. Each summer, its height increases by 1 meter.

Laura plants a Utopian Tree sapling with a height of 1 meter at the onset of spring. How tall will her tree be after \$N\$ growth cycles?

Input Format

The first line contains an integer, \$T\$, the number of test cases. \$T\$ subsequent lines each contain an integer, \$N\$, denoting the number of cycles for that test case.

Constraints

\$1 \le T \le 10\$ \$0 \le N \le 60\$

Output Format

For each test case, print the height of the Utopian Tree after \$N\$ cycles. Each height must be printed on a new line.

Sample Input

3 0 1 4

Sample Output

1 2 7

Explanation

There are 3 test cases.

In the first case (N = 0), the initial height (H = 1) of the tree remains unchanged.

In the second case (\$N = 1\$), the tree doubles in height and is \$2\$ meters tall after the spring cycle.

In the third case (\$N = 4\$), the tree doubles its height in spring (\$H = 2\$), then grows a meter in summer (\$H = 3\$), then doubles after the next spring (\$H = 6\$), and grows another meter after summer (\$H = 7\$). Thus, at the end of 4 cycles, its height is \$7\$ meters.
